Baseline Script:

On the left is the editor where you will write the blogpost. A draft blogpost is provided to start.
At the top of the blogpost, you can see tips for writing research paper blogposts.
You can also manually save your draft, although the tool will also store history once per minute.

On the top right is your paper that you will be writing about.
Here, you can close or open all the paper sections. You can also manually close and open each paper section.
And on the bottom right is a place to give the AI tool instructions for generating writing. [type example instructions: “Make this sentence shorter: “]
The AI tool will not automatically take into account text from the editor or paper, but you can copy text from the editor or paper and paste it into the instructions if you’d like. [copy first blog post sentence into instructions]
When you click the generate button [click generate], the generation may take some time, and it appears here.
When you generate writing, you can copy it. [click copy]
You can also use the arrows here to see older and newer generated writings along with their inputs.

Treatment Script:

On the left is where you will write the blogpost.
A draft blogpost is provided to start.
The blogpost is divided into sections, which you can open and close, move around, delete and add.
For each section, you can adjust its header as well as its contents.
When you add a new section, you can choose to create a blank section [show] or generate text automatically for that section based on the section header [show]. Generations, especially for a new section, may take some time.
At the top of the blogpost, you can see its word count, a preview of what it will look like with all the sections together, and tips for writing research paper blogposts.
You can also manually save your draft, although the tool will also store history once per minute.

On the right is where you can work on generating more writing for the highlighted blog post section.
The available steps for generating writing are numbered for you.
For the first step, you can go to the paper text to select relevant paragraphs that you want to write about, and go to the paper outline to select relevant bulletpoints. There will be pre-selected bulletpoints that the tool used for the draft.
You can click to the left of each set of bulletpoints to see its corresponding paragraph and vice versa.
Here, you can clear all selected paragraphs and bulletpoints, show only the selected paragraphs and bulletpoints, and close or open all the paper sections.
You can also manually close and open each paper section.

For the second step, you can leave the length of the writing to be automatically decided, or you can select a particular length.
For the third step, you can specify whether or not you want the writing that you're generating for the highlighted blog post section to take into account the context of the blogpost sections above it.
For the fourth step, you can specify any custom bulletpoints you want the writing to cover. [type an example]
For the fifth step, you can provide any custom instructions for the writing. [scroll through]
For the sixth step, you can provide any starting text from which the generated writing should continue. [type "Despite"]
When you click the generate button [click], the generation may take some time, and it appears here.
You can copy the generated writing [copy] as well as use the arrows here to see older and newer generated writings along with their inputs.

If you want to modify any writing, you can come down here and follow the available steps.
For the first step, you must specify the writing to modify.
[copy/paste first sentence of blog post]
For the second step, you can specify the desired length of the modified writing, and for the third step, you can specify whether or not you want the modified writing to take into account the context of the blogpost sections above it.
For the fourth step, you can specify whether or not the modified writing should be based on the selected paragraphs and bulletpoints above.
For the fifth step, you can add any custom instructions for the modification.
For the last step, you have several options for the modifying action, including doing a custom modification based on your custom instructions. [click condense]

You can copy the modified writing as well as use the arrows here to see older and newer modified writings along with their inputs.

This “generate writing” box keeps track of the generation settings and generated writings **for each blogpost section**, so you can see that the contents of the “generate writing” box update when you switch blogpost sections.
