Subject Monthly Report - September 1982

This month I provided Dave McCormack with engineering assistance on his project to get the rail monitor operational. This assistance was in the form of calculations and structural load estimates to determine the placement of detectors.

Early in the month I also helped Dave McCormack and Monte Sula with overseeing the collection of river water samples in the 100 Areas. These samples are part of the investigation of an apparent strontium source at the 100-B Area.

Last week Chuck Cline gave me his file on the Technical Task he has been doing and briefed me on its status. This task involves reformatting all CIRMIS programs that pertain to historical contaminant data files and the new data input format.

This month I also coordinated some ground-water sampling for Rockwell. The samples were supplied by Rockwell and testing was done for organics and inorganic toxic metals.
