Geophysical Log Interpretation (Cont'd.)

A meeting was held with P. Heasler, J. Zellmer, G. Petrie, and S. Blair to review the data set and determine methods of approach to the analysis. A copy of the analytical plan is being prepared.

Gregg Petrie has been thoroughly briefed on this task and will assume project management responsibility on April 26, 1982. S. C. Blair will continue to participate in this task, but at a lower level of effort.

- Aquifer Testing

  The test that was tentatively scheduled for well 699-20-20 will not be conducted, because the pump has apparently become sand locked. The pump will be removed from this well, and a test will be set up at another well.

- VTT Update

  No information was received.

- Bank Storage

  Progress on the bank storage task this month included test pumping of three Golder wells (#87, #108, and #110) to determine their suitability as water level recording stations. With some work, these wells can probably be adapted to our needs.

  Various alternative methods for obtaining a continuous record of the river level are being investigated.
