Subject Monthly Report - September 1981

In the first week of September, I was sold to Monte Sula to work with the Surface Monitoring Group.

My first task with this group was to assess the extent of denatured artemisia tridentata, in an area just north of Horn Rapids Road. This area was checked out for recent fires with Hanford Fire Department. A field check gave no sign of fire and the Hanford Fire Department had no record of a fire in that area. A contour zone map of the devastated area was made. A literature search on the effects of fluorides on plants was done. This was done for Keith Price.

Maintenance work was done on ^{129}I river sampler - this work was done with Dave McCormack.

Tritium water samples were mixed for Dick Jaquish to be used as testing standards for an audit on U.S. Testing Labs. These standards are to be sent to the University of Miami for counting.

Wells with recorders in the 300 Area were sampled during the first of this month.

Ted Austin was given a Hanford Well Locations Manual.
