Ground-Water Program

Special samples of three wells in the 300 Area and the river along the area continued to be collected and submitted for organic analysis during September. Some equipment problems interrupted sampling efforts late in the month, however, the sampling was discontinued at this point so lost sample time was minimal. A new air compressor was obtained to replace the existing unit which was continually giving us problems. The new organic sample pump installation on the well rig appears to be working satisfactorily thus far.

Special samples were collected around Gable Mountain Pond for Rockwell at their request. The samples were submitted to UST for special emergency strontium-90 analysis.

Overtime was worked on two weekends which both used up some excess dollars found in the ground-water program and helped us to get caught up to some extent on the routine well sampling program. Depending on the amount and number of special requests we receive in the near future the routine sampling should be collected within scheduling restraints through the remainder of CY 1984.
