special high volume air samples were collected in the immediate downwind direction from PUREX extending to near the site boundary. Additionally, a special collection and compositing of routine air sample filters was made. All samples were analyzed for ^{238}Pu and $^{239,240}Pu$. Only two samples out of the total of 16 showed significant results; the composite from Horn Rapids Road showed 1.6E-4 ± 9.6E-5 pCi/m^3 and the 300 Area composite showed 2.7E-4 ± 1.6E-4 pCi/m^3. The maximum value at either of these locations during CY 1983 was 1.0E-4 ± 3.0E-5 for the 300 Area composite.

Program Management

The quarterly information exchange meeting was held with site contractor representatives.
