

Appendix IV

Spacing within prosodic groups of words

The whole manuscript text of *Beowulf* is written with spacing features conformant to linguistic (and metrical) patterns. Some of the patterns whose domain is the halfline and a few whose domain is a whole line are illustrated in this appendix.

A. Some repeated formulas.

C. The occurrences of “semi-adverbial” *þæs*. In every instance this form occurs early in the halfline beginning a clause; Klaeber punctuates the end of the preceding halfline with semicolon, full stop, question mark, or places dashes on either side of the halfline.

D. About 150 *a*-verses have the structure *X and Y*, usually coordinate nouns or adjectives. Most of them link the coordinate forms by alliteration; the others—about one in fifteen—link them in formulas of rhyme (*frōd and gōd*), or in formulas of inclusiveness for a semantic field (*dæges and nihtes*). Just over 20 *b*-verses have the same structure, without alliterative linking of the coordinate elements, of course.

There is a pervasive pattern of the *Y*-element being longer as in 2349, or heavier as in 1074, or phonotactically more divided as in 1898, 2166, or morphotactically more complex as in 350, 1127 than the *X*-element. The only exceptions occur in verses in which these elements have equivalent weight, such as *fyrene 7 fæhðe* 137 beside *fæhðe 7 fyrene* 879, or *sæla 7 mæla*. It is easy enough to explain in most theories that *swelan and swellan* is metrical, while *swellan and swelan* probably isn't. But routine A-type *brād ond brūn-ecg*, which could be reversed as E-type *brūn-ecg ond brād*, doesn't appear, nor does anything like it. There is *lāc ond luf-tācn* but no reversal of the type. There is also A-type *yrre ond an-ræd*, but no chance of reversing the constituents to produce D-type *an-ræd ond yrre*, and the reason is not the (probably) short syllable in the first arsis. The pattern does not seem to be explainable by scansion based on word-stress patterns.

1. *X ond Y* formula in *a*-verse.

E. Not least in regard to demonstrating textual information being carried by spacings—and in contradicting the notion of there being such a thing as “normal word division” of this text—are the spacing features of verse half-lines filled by a single word. Only those occurring within lines 1–661 are listed here.
